

SAMHSA's Trauma-Informed Approach: Key Assumptions and Principles

Trauma researchers, practitioners and survivors have recognized that the understanding of trauma and trauma-specific interventions is not sufficient to optimize outcomes for trauma survivors nor to influence how service systems conduct their business.

The context in which trauma is addressed or treatments deployed contributes to the outcomes for the trauma survivors, the people receiving services, and the individuals staffing the systems. Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.^{22,32,33} SAMHSA's concept of a trauma-informed approach is grounded in a set of four assumptions and six key principles.

A program, organization, or system that is trauma-informed realizes the widespread impact of trauma and understands potential paths for recovery; recognizes the signs and symptoms of trauma in clients, families, staff, and others involved with the system; and responds by fully integrating knowledge about trauma into policies, procedures, and practices, and seeks to actively resist re-traumatization.

A trauma informed approach is distinct from trauma-specific services or trauma systems. A trauma informed approach is inclusive of trauma-specific interventions, whether assessment, treatment or recovery supports, yet it also incorporates key trauma principles into the organizational culture.

Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.

THE FOUR "R'S": KEY ASSUMPTIONS IN A TRAUMA-INFORMED APPROACH

In a trauma-informed approach, all people at all levels of the organization or system have a basic **realization** about trauma and understand how trauma can affect families, groups, organizations, and communities as well as individuals. People's experience and behavior are understood in the context of coping strategies designed to survive adversity and overwhelming circumstances, whether these occurred in the past (i.e., a client dealing with prior child abuse), whether they are currently manifesting (i.e., a staff member living with domestic violence in the home), or whether they are related to the emotional distress that results in hearing about the firsthand experiences of another (i.e., secondary traumatic stress experienced by a direct care professional). There is an understanding that trauma plays a role in mental and substance use disorders and should be systematically addressed in prevention, treatment, and recovery settings. Similarly, there is a realization that trauma is not confined to the behavioral health specialty service sector, but is integral to other systems (e.g., child welfare, criminal justice, primary health care, peer-run and community organizations) and is often a barrier to effective outcomes in those systems as well.

People in the organization or system are also able to **recognize** the signs of trauma. These signs may be gender, age, or setting-specific and may be manifest by individuals seeking or providing services in these settings. Trauma screening and assessment assist in the recognition of trauma, as do workforce development, employee assistance, and supervision practices.

The program, organization, or system **responds** by applying the principles of a trauma-informed approach to all areas of functioning. The program, organization, or system integrates an understanding that the experience of traumatic events impacts all people involved, whether directly or indirectly. Staff in every part of the organization, from the person who greets clients at the door to the executives and the governance board, have changed their language, behaviors and policies to take into consideration the experiences of trauma among children and adult users of the services and among staff providing the services. This is accomplished through staff training, a budget that supports this ongoing training, and leadership that realizes the role of trauma in the lives of their staff and the people they serve. The organization has practitioners trained in evidence-based trauma practices. Policies of the organization, such as mission statements, staff handbooks and manuals promote a culture based on beliefs about resilience, recovery, and healing from trauma. For instance, the agency's mission may include an intentional statement on the organization's commitment to promote trauma recovery; agency policies demonstrate a commitment to incorporating perspectives of people served through the establishment of client advisory boards or inclusion of people who have received services on the agency's board of directors; or agency training includes resources for mentoring supervisors on helping staff address secondary traumatic stress. The organization is committed to providing a physically and psychologically safe environment. Leadership ensures that staff work in an environment that promotes trust, fairness and transparency. The program's, organization's, or system's response involves a universal precautions approach in which one expects the presence of trauma in lives of individuals being served, ensuring not to replicate it.

A trauma-informed approach seeks to **resist re-traumatization** of clients as well as staff. Organizations often inadvertently create stressful or toxic environments that interfere with the recovery of clients, the well-being of staff and the fulfillment of the organizational mission.²⁷ Staff who work within a trauma-informed environment are taught to recognize how organizational practices may

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

1. Safety
2. Trustworthiness and Transparency
3. Peer Support
4. Collaboration and Mutuality
5. Empowerment, Voice and Choice
6. Cultural, Historical, and Gender Issues

From SAMHSA's perspective, it is critical to promote the linkage to recovery and resilience for those individuals and families impacted by trauma. Consistent with SAMHSA's definition of recovery, services and supports that are trauma-informed build on the best evidence available and consumer and family engagement, empowerment, and collaboration.

The six key principles fundamental to a trauma-informed approach include:^{24,36}

1. **Safety:** Throughout the organization, staff and the people they serve, whether children or adults, feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety. Understanding safety as defined by those served is a high priority.
2. **Trustworthiness and Transparency:** Organizational operations and decisions are conducted with transparency with the goal of building and maintaining trust with clients and family members, among staff, and others involved in the organization.
3. **Peer Support:** Peer support and mutual self-help are key vehicles for establishing safety and hope, building trust, enhancing collaboration, and utilizing their stories and lived experience to promote recovery and healing. The term "Peers" refers to individuals with lived experiences of trauma, or in the case of children this may be family members of children who have experienced traumatic events and are key caregivers in their recovery. Peers have also been referred to as "trauma survivors."
4. **Collaboration and Mutuality:** Importance is placed on partnering and the leveling of power differences between staff and clients and among organizational staff from clerical and housekeeping personnel, to professional staff to administrators, demonstrating that healing happens in relationships and in the meaningful sharing of power and decision-making. The organization recognizes that everyone has a role to play in a trauma-informed approach. As one expert stated: "one does not have to be a therapist to be therapeutic."¹²

5. **Empowerment, Voice and Choice:** Throughout the organization and among the clients served, individuals' strengths and experiences are recognized and built upon. The organization fosters a belief in the primacy of the people served, in resilience, and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. The organization understands that the experience of trauma may be a unifying aspect in the lives of those who run the organization, who provide the services, and/or who come to the organization for assistance and support. As such, operations, workforce development and services are organized to foster empowerment for staff and clients alike. Organizations understand the importance of power differentials and ways in which clients, historically, have been diminished in voice and choice and are often recipients of coercive treatment. Clients are supported in shared decision-making, choice, and goal setting to determine the plan of action they need to heal and move forward. They are supported in cultivating self-advocacy skills. Staff are facilitators of recovery rather than controllers of recovery.³⁴ Staff are empowered to do their work as well as possible by adequate organizational support. This is a parallel process as staff need to feel safe, as much as people receiving services.
6. **Cultural, Historical, and Gender Issues:** The organization actively moves past cultural stereotypes and biases (e.g. based on race, ethnicity, sexual orientation, age, religion, gender-identity, geography, etc.); offers, access to gender responsive services; leverages the healing value of traditional cultural connections; incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; and recognizes and addresses historical trauma.

Guidance for Implementing a Trauma-Informed Approach

Developing a trauma-informed approach requires change at multiples levels of an organization and systematic alignment with the six key principles described above. The guidance provided here builds upon the work of Harris and Fallot and in conjunction with the key principles, provides a starting point for developing an organizational trauma-informed approach.²⁵ While it is recognized that not all public institutions and service sectors attend to trauma as an aspect of how they conduct business, understanding the role of trauma and a trauma-informed approach may help them meet their goals and objectives. Organizations, across service-sectors and systems, are encouraged to examine how a trauma-informed approach will benefit all stakeholders; to conduct a trauma-informed organizational assessment and change process; and to involve clients and staff at all levels in the organizational development process.

The guidance for implementing a trauma-informed approach is presented in the ten domains described below. This is not provided as a "checklist" or a prescriptive step-by-step process. These are the domains of organizational change that have appeared both in the organizational change management literature and among models for establishing trauma-informed care.^{35,36,37,38} What makes it unique to establishing a trauma-informed organizational approach is the cross-walk with the key principles and trauma-specific content.

TEN IMPLEMENTATION DOMAINS

1. Governance and Leadership
2. Policy
3. Physical Environment
4. Engagement and Involvement
5. Cross Sector Collaboration
6. Screening, Assessment, Treatment Services
7. Training and Workforce Development
8. Progress Monitoring and Quality Assurance
9. Financing
10. Evaluation

GOVERNANCE AND LEADERSHIP:

The leadership and governance of the organization support and invest in implementing and sustaining a trauma-informed approach; there is an identified point of responsibility within the organization to lead and oversee this work; and there is inclusion of the peer voice. A champion of this approach is often needed to initiate a system change process.

POLICY: There are written policies and protocols establishing a trauma-informed approach as an essential part of the organizational mission. Organizational procedures and cross agency protocols, including working with community-based agencies, reflect trauma-informed principles. This approach must be "hard-wired" into practices and procedures of the organization, not solely relying on training workshops or a well-intentioned leader.

PHYSICAL ENVIRONMENT OF THE ORGANIZATION: The organization ensures that the physical environment promotes a sense of safety and individuals. Staff working in the organization and individuals being served must experience the setting as safe, inviting, and not a risk to their physical or psychological safety. The physical setting also supports the collaborative aspect of a trauma informed approach through openness, transparency, and shared spaces.

ENGAGEMENT AND INVOLVEMENT OF PEOPLE IN RECOVERY, TRAUMA SURVIVORS, PEOPLE RECEIVING SERVICES, AND FAMILY MEMBERS RECEIVING SERVICES: These groups have significant involvement, voice, and meaningful choice at all levels and in all areas of organizational functioning (e.g., program design, implementation, service delivery, quality assurance, cultural competence, access to trauma-informed peer support, workforce development, and evaluation.) This is a key value and aspect of a trauma-informed approach that differentiates it from the usual approaches to services and care.

CROSS SECTOR COLLABORATION:

Collaboration across sectors is built on a shared understanding of trauma and principles of a trauma-informed approach. While a trauma focus may not be the stated mission of various service sectors, understanding how awareness of trauma can help or hinder achievement of an organization's mission is a critical aspect of building collaborations. People with significant trauma histories often present with a complexity of needs, crossing various service sectors. Even if a mental health clinician is trauma-informed, a referral to a trauma-innovative program could then undermine the progress of the individual.

SCREENING, ASSESSMENT, AND TREATMENT SERVICES: Practitioners use and are trained in interventions based on the best available empirical evidence and science, are culturally appropriate, and reflect principles of a trauma-informed approach. Trauma screening and assessment are an essential part of the work. Trauma-specific interventions are acceptable, effective, and available for individuals and families seeking services. When trauma-specific services are not available within the organization, there is a trusted, effective referral system in place that facilitates connecting individuals with appropriate trauma treatment.

TRAINING AND WORKFORCE DEVELOPMENT: On-going training on trauma and peer-support are essential. The organization's human resource system incorporates trauma-informed principles in hiring, supervision, staff evaluation; procedures are in place to support staff with trauma histories and/or those experiencing significant secondary traumatic stress or vicarious trauma, resulting from exposure to and working with individuals with complex trauma.

PROGRESS MONITORING AND QUALITY ASSURANCE: There is ongoing assessment, tracking, and monitoring of trauma-informed principles and effective use of evidence-based trauma specific screening, assessments and treatment.

FINANCING:

Financing structures are designed to support a trauma-informed approach which includes resources for: staff training on trauma, key principles of a trauma-informed approach; development of appropriate and safe facilities; establishment of peer-support; provision of evidence-supported trauma screening, assessment, treatment, and recovery supports; and development of trauma-informed cross-agency collaborations.

EVALUATION: Measures and evaluation designs used to evaluate service or program implementation and effectiveness reflect an understanding of trauma and appropriate trauma-oriented research instruments.

To further guide implementation, the chart on the next page provides sample questions in each of the ten domains to stimulate change-focused discussion. The questions address examples of the work to be done in any particular domain yet also reflect the six

key principles of a trauma-informed approach.

Many of these questions and concepts were adapted from the work of Fallot and Harris, Henry, Black-Pond, Richardson, & Vandervort, Hummer and Dollard, and Penney and Cave.^{39, 40, 41,42}

While the language in the chart may seem more familiar to behavioral health settings, organizations across systems are encouraged to adapt the sample questions to best fit the needs of the agency, staff, and individuals being served. For example, a juvenile justice agency may want to ask how it would incorporate the principle of safety when examining its physical environment. A primary care setting may explore how it can use empowerment, and choice and when developing policies and procedures to provide trauma-informed services (e.g. explaining step by step a potentially invasive procedure to a patient at an OB/GYN office).
